Convergence

$$\tilde{f}(x) = a_1 \varphi_1(x) + \dots + a_n \varphi_n(x)$$

$$f'(x) \approx \tilde{f}'(x) = a_1 \varphi_1'(x) + \dots + a_n \varphi_n'(x)$$

$$f'(x) = [\varphi_1'(x), \dots, \varphi_n'(x)] \begin{bmatrix} a_1 \\ \vdots \\ a_n \end{bmatrix}$$

$$V' := \begin{matrix} & \varphi_1' & & \varphi_n' \\ x_1 & \left[ \begin{array}{ccc} \varphi_1'(x_1) & \dots & \varphi_n'(x_1) \end{array} \right. \\ & \vdots & & \\ x_n & \left. \begin{array}{c} \varphi_1'(x_n) \end{array} \right] \end{matrix}$$

Given points  $f(\vec{x})$

would like  $f'(\vec{x})$

$$\tilde{f}'(\vec{x}) = V' V^{-1} f(\vec{x})$$

# About Differentiation Matrices

How could you find coefficients of the derivative in the original basis  $(\varphi_i)$ ?

$$V^{-1} V' V^{-1} = f'(x) \rightarrow \text{weights}$$

Give a matrix that finds the second derivative.

$$V' V^{-1} V' V^{-1} V' V^{-1} \rightarrow \text{Differentiation matrix}$$

$\uparrow \uparrow$   $x$ -coordinates  $+ (\varphi)_i, (\varphi')_i$

$$y' = V' V^{-1} y$$

$\uparrow$  approximation of  $f'(x)$  at each  $x$

degree  $n-1$  polynomial at  $n$ -points

$$V^{-1} \quad V^{-1} \quad V^{-1} y$$

coeffs of  $f'$   
in orig. basis

coefficients of  $f'$   
in diff. basis

coefficients of  $f$   
in orig. basis

values of  $f'$   
at each point  
 $x_1, \dots, x_n$

**Demo:** Taking derivatives with Vandermonde matrices

## Finite Difference Formulas

It is possible to use the process above to find 'canned' formulas for taking derivatives. Suppose we use three points equispaced points  $(x - h, x, x + h)$  for interpolation (i.e. a degree-2 polynomial).

- ▶ What is the resulting differentiation matrix?
- ▶ What does it tell us for the middle point?

$$V = \begin{bmatrix} 1 & x-h & (x-h)^2 \\ 1 & x & x^2 \\ 1 & x+h & (x+h)^2 \end{bmatrix} \quad V^{-1} = \begin{bmatrix} 0 & 1 & 2(x-h) \\ 0 & 1 & 2x \\ 0 & 1 & 2(x+h) \end{bmatrix}$$

$$D = V^{-1} V^{-1} = \begin{bmatrix} -\frac{1}{2h} & \dots & \frac{1}{2h} \\ \dots & 0 & \dots \end{bmatrix}$$

$$D \cdot V = V'$$

$$\begin{bmatrix} \frac{-1}{2h} & 0 & \frac{1}{2h} \end{bmatrix} \begin{bmatrix} 1 & x-h & (x-h)^2 \\ 1 & x & x^2 \\ 1 & x+h & (x+h)^2 \end{bmatrix}$$

$$= \begin{bmatrix} 0 & \uparrow & 2x \end{bmatrix} \begin{matrix} \frac{2xh}{2h} + \frac{2xh}{2h} \\ \frac{-(x-h)^2}{2h} + \frac{(x+h)^2}{2h} \end{matrix}$$

$\swarrow \frac{x-h}{2h} + \frac{x+h}{2h}$

$$D \cdot \begin{bmatrix} f(x+h) \\ f(x) \\ f(x-h) \\ \vdots \end{bmatrix} = \begin{bmatrix} \frac{f(x+h) - f(x-h)}{2h} \\ \vdots \end{bmatrix}$$

$\underbrace{\hspace{10em}}_{O(h^2)}$

$D$  der d. gegen

$$\begin{bmatrix} \ddots & & & & \\ \frac{1}{2h} & 0 & \frac{1}{2h} & & \\ \ddots & \ddots & 0 & \frac{1}{2h} & \\ \frac{1}{2h} & 0 & \frac{1}{2h} & & \\ \ddots & \ddots & \frac{1}{2h} & 0 & \frac{1}{2h} \\ & & & \ddots & \ddots \end{bmatrix} \cdot \begin{bmatrix} \vdots \\ \vdots \\ \vdots \\ \vdots \\ \vdots \\ \vdots \end{bmatrix} = \begin{bmatrix} \vdots \\ \vdots \\ \vdots \\ \vdots \\ \vdots \\ \vdots \end{bmatrix}$$

$f(x) = \frac{df_c(x)}{dx} = b$

Can we use a similar process to compute (approximate) integrals of a function  $f$ ?

$$\tilde{f}(x) = a_1 \phi_1(x) + \dots + a_n \phi_n(x)$$

$$\int_a^b f(x) dx \approx \int_a^b \tilde{f}(x) dx = a_1 \int_a^b \phi_1(x) dx + \dots + a_n \int_a^b \phi_n(x) dx$$

↑  
loss of accuracy

$$w = \begin{bmatrix} \int_a^b \phi_1(x) dx \\ \vdots \\ \int_a^b \phi_n(x) dx \end{bmatrix}$$

← vector of weights  
 $w^T \cdot a = y$   
 weights

## Example: Building a Quadrature Rule

**Demo:** Computing the Weights in Simpson's Rule

Suppose we know

$$f(x_0) = 2 \quad f(x_1) = 0 \quad f(x_2) = 3$$

$$x_0 = 0 \quad x_1 = \frac{1}{2} \quad x_2 = 1$$

How can we find an approximate integral?

$$\int_0^1 f(x) dx$$

$$w = \begin{bmatrix} \int_0^1 1 dx \\ \vdots \\ \int_0^1 x^2 dx \end{bmatrix} = \begin{bmatrix} 1 \\ 1/2 \\ 1/3 \end{bmatrix}$$

$$V = \begin{bmatrix} 1 & 0 & 0 \\ 1 & 1/2 & 1/4 \\ 1 & 1 & 1 \end{bmatrix} \rightarrow \begin{bmatrix} x_0^2 & x_0 & 1 \\ x_1^2 & x_1 & 1 \\ x_2^2 & x_2 & 1 \end{bmatrix}$$

$$a = V^{-1} \begin{bmatrix} 2 \\ 0 \\ 3 \end{bmatrix} = \begin{bmatrix} 2 \\ 1 \\ 1 \end{bmatrix}$$

$$\begin{aligned} \text{integral} &= w^T \cdot a \\ &= \underbrace{w^T}_{\text{weights}(x)} V^{-1} y \end{aligned} \quad (x, y)$$

## Facts about Quadrature

What does Simpson's rule look like on  $[0, 1/2]$ ?

What does Simpson's rule look like on  $[5, 6]$ ?

How accurate is Simpson's rule with  $n$  points and functions?

Accuracy with  $n$  points/function

Interpolation error  $O(h^{n+1})$

Integration error  $O(h^{n+2})$

Differentiation error  $O(h^n)$

## Solving Nonlinear Equations

What is the goal here?

# Bisection Method

Assume there is a zero on the interval  $[a, b]$  and that  $f$  is continuous, perform binary search.

**Demo:** Bisection Method

What's the rate of convergence? What's the constant?

## Newton's Method

Derive Newton's method.

**Demo:** Newton's method

**Demo:** Convergence of Newton's Method

What are some **drawbacks** of Newton?

## Secant Method

What would Newton without the use of the derivative look like?

**Demo:** Secant Method

**In-class activity:** Nonlinear equations in 1D

# Optimization

State the problem.

## Optimization: What could go wrong?

What are some potential problems in optimization?

## Optimization: What is a solution?

How can we tell that we have a (at least local) minimum? (Remember calculus!)

## Newton's Method

Let's steal the idea from Newton's method for equation solving:  
Build a simple version of  $f$  and minimize that.

**Demo:** Newton's method in 1D

**In-class activity:** Optimization Methods

## Golden Section Search

Would like a method like bisection, but for optimization.

In general: No invariant that can be preserved.

Need *extra assumption*.

## Demo: Golden Section Search Proportions
