Finite Difference Methods

▶ Lets derive the finite difference method for the ODE BVP defined by

with boundary conditions
$$u(-1) = 3$$
 and $u(1) = -3$.

 $u_1 \approx u(+1)$, for $t_1 = t_2$

centered $t_1 = t_2$
 $u_2 = t_3$
 $u_3 = t_4$
 $u_4 = t_4$
 $u_5 = t_4$
 $u_5 = t_4$
 $u_5 = t_5$
 $u_6 = t_5$
 $u_7 = t_7$
 $u_{11} = t_{1000}$
 $u_{12} = t_7$
 $u_{11} = t_7$
 $u_{12} = t_7$
 $u_{11} = t_7$
 $u_{12} = t_7$
 $u_{13} = t_7$
 $u_{14} = t_7$
 u_{14

Collocation Methods

 \triangleright Collocation methods approximate u by representing it in a basis

$$y(t) = v(t,x) = \sum_{i=1}^{n} c_{i} \phi_{i}(t).$$

$$t_{i} = f(t_{i}, \forall (t_{i}, x_{i})) = f(t_{i}, \forall (t_{i}, x_{i}))$$
ensure that each ϕ_{i} salicifies BCs $f(t_{i}, x_{i})$

$$Spectral methods use polynomials or trigonometric functions for ϕ_{i} , which$$

Spectral methods use polynomials or trigonometric functions for ϕ_i , which are nonzero over most of [a,b], while finite element methods leverage basis functions with local support (e.g. B-splines).

Solving BVPs by Optimization

▶ We reformulate the collocation approximation as an optimization problem:

$$r(t_1,x) = v(t_1,x) - f(t_1,v(t_1,x))$$

$$F(x) = V(x; x) - 4(x; x)$$

$$= \sum_{j=1}^{n} x_{j} e_{j}(x) - f(x) + f(x)$$

$$F(x) = \frac{1}{2} \int_{a}^{b} ||f(x)||_{2}^{2} dx$$

► The first-order optimality conditions of the optimization problem are a ^

system of linear equations
$$Ax = b$$
: $f(x,y) = f(x)$, $r(x,y) = \sum_{j=1}^{n} f(x_j) = \sum_{j=1}$

system of linear equations
$$Ax = b$$
: $f(\lambda, y) = f(\lambda)$, $r(\lambda, \lambda) = f(\lambda, y) = f(\lambda)$

$$0 = \frac{\partial F(\lambda)}{\partial x_{i}} = \int_{0}^{b} r(\lambda, x)^{T} \frac{\partial r}{\partial x_{i}} (\lambda, x) d\lambda$$

Weighted Residual

Weighted residual methods work by ensuring the residual is orthogonal with respect to a given set of weight functions: $\psi_{1}(4)$

$$0 = \int_{0}^{1} r(1,x)^{T} \Psi_{1}(1) dt$$
 $f(1,y) = f(1)$
 $f(1,y) = f(1)$
 $f(1,y) = f(1)$
 $f(1,y) = f(1)$

The Galerkin method is a weighted residual method where $w_i = \phi_i$.

Linear BVPs by Optimization

Lets apply the Galerkin method to the more general linear ODE ${m f}(t,y)={m A}(t){m y}(t)+{m b}(t)$ with residual equation,

$$f(t,y) = A(t)y(t) + b(t) \text{ with residual equation,}$$

$$f' = V' - f = V' - A V - b$$

$$f'(t,x) = \sum_{i} y_i e_i - A \sum_{i} y_i e_i + b(t)$$

$$f'(t,x) = \sum_{i} y_i e_i - A \sum_{i} y_i e_i + b(t)$$

$$f'(t,x) = \sum_{i} y_i e_i - A \sum_{i} y_i e_i + b(t)$$

$$f'(t,x) = \sum_{i} y_i e_i - A \sum_{i} y_i e_i + b(t)$$

$$f'(t,x) = \sum_{i} y_i e_i - A \sum_{i} y_i e_i + b(t)$$

$$f'(t,x) = \sum_{i} y_i e_i - A \sum_{i} y_i e_i + b(t)$$

$$f'(t,x) = \sum_{i} y_i e_i - A \sum_{i} y_i e_i + b(t)$$

$$f'(t,x) = \sum_{i} y_i e_i - A \sum_{i} y_i e_i + b(t)$$

$$f'(t,x) = \sum_{i} y_i e_i - A \sum_{i} y_i e_i + b(t)$$

$$f'(t,x) = \sum_{i} y_i e_i - A \sum_{i} y_i e_i + b(t)$$

$$f'(t,x) = \sum_{i} y_i e_i - A \sum_{i} y_i e_i + b(t)$$

$$f'(t,x) = \sum_{i} y_i e_i - A \sum_{i} y_i e_i + b(t)$$

$$f'(t,x) = \sum_{i} y_i e_i - A \sum_{i} y_i e_i + b(t)$$

$$f'(t,x) = \sum_{i} y_i e_i - A \sum_{i} y_i e_i + b(t)$$

$$f'(t,x) = \sum_{i} y_i e_i - A \sum_{i} y_i e_i + b(t)$$

$$f'(t,x) = \sum_{i} y_i e_i - A \sum_{i} y_i e_i + b(t)$$

$$f'(t,x) = \sum_{i} y_i e_i - A \sum_{i} y_i e_i + b(t)$$

$$f'(t,x) = \sum_{i} y_i e_i - A \sum_{i} y_i e_i + b(t)$$

$$f'(t,x) = \sum_{i} y_i e_i - A \sum_{i} y_i e_i + b(t)$$

$$f'(t,x) = \sum_{i} y_i e_i - A \sum_{i} y_i e_i + b(t)$$

$$f'(t,x) = \sum_{i} y_i e_i - A \sum_{i} y_i e_i + b(t)$$

$$f'(t,x) = \sum_{i} y_i e_i - A \sum_{i} y_i e_i + b(t)$$

$$f'(t,x) = \sum_{i} y_i e_i - A \sum_{i} y_i e_i + b(t)$$

$$f'(t,x) = \sum_{i} y_i e_i - A \sum_{i} y_i e_i + b(t)$$

$$f'(t,x) = \sum_{i} y_i e_i - A \sum_{i} y_i e_i + b(t)$$

$$f'(t,x) = \sum_{i} y_i e_i - A \sum_{i} y_i e_i + b(t)$$

$$f'(t,x) = \sum_{i} y_i e_i - A \sum_{i} y_i e_i + b(t)$$

$$f'(t,x) = \sum_{i} y_i e_i - A \sum_{i} y_i e_i + b(t)$$

$$= \frac{2}{3} \frac{1}{5} \frac{1}{6} \frac{$$

Nonlinear BVPs: Poisson Equation

In practice, BVPs are at least second order and its advantageous to work in the natural set of variables.

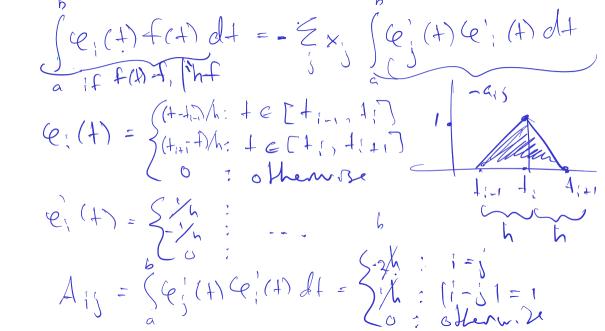

Consider the Poission equation u'' = f(t) with boundary conditions u(a) = u(b) = 0 and define a localized basis of hat functions:

$$\phi_i(t) = \begin{cases} (t-t_{i-1})/h & : t \in [t_{i-1},t_i] \\ (t_{i+1}-t)/h & : t \in [t_i,t_{i+1}] \\ 0 & : \text{otherwise} \end{cases}$$
 in the second of the second of

where
$$t_0 = t_1 = a$$
 and $t_{n+1} = t_n = b$.

$$r \in V'' - f \Rightarrow$$
 condefined
 $r(f, x) = \underbrace{\xi}_{x, y} e''(x) - f(f)$

Weak Form and the Finite Element Method on ophnization over one, to find twice - differentiable ▶ The finite-element method permits a lesser degree of differentiability of basis functions by casting the ODE in weak form: w(H2)(A) = { x (e'(A)

Finite Element Methods in Practice

► Hat functions are linear instances of *B-splines*:

degree t, to-times differentiable

Finite-element methods readily generalize to PDEs:

FEM with triangles tetrahedre

Eigenvalue Problems with ODEs

▶ A typical second-order scalar BVP eigenvalue problem has the form

A typical second-order scalar BVP eigenvalue problem has the form
$$u'' = \lambda f(t, u, u'), \quad \text{with boundary conditions } u(a) = 0, u(b) = 0$$

$$f(f, u, u') = g(f) \quad u$$

$$u_1 + f(f, u, u') = g(f) \quad u$$

$$u_2 + f(f, u, u') = g(f) \quad u$$

$$u_3 + f(f, u, u') = g(f) \quad u$$

$$u_4 + f(f, u, u') = g(f) \quad u$$

$$u_4 + f(f, u, u') = g(f) \quad u$$

$$u_4 + f(f, u, u') = g(f) \quad u$$

$$u_4 + f(f, u, u') = g(f) \quad u$$

$$u_4 + f(f, u, u') = g(f) \quad u$$

$$u_4 + f(f, u, u') = g(f) \quad u$$

$$u_4 + f(f, u, u') = g(f) \quad u$$

$$u_4 + f(f, u, u') = g(f) \quad u$$

$$u_4 + f(f, u, u') = g(f) \quad u$$

$$u_4 + f(f, u, u') = g(f) \quad u$$

$$u_4 + f(f, u, u') = g(f) \quad u$$

$$u_4 + f(f, u, u') = g(f) \quad u$$

$$u_4 + f(f, u, u') = g(f) \quad u$$

$$u_4 + f(f, u, u') = g(f) \quad u$$

$$u_4 + f(f, u, u') = g(f) \quad u$$

$$u_4 + f(f, u, u') = g(f) \quad u$$

$$u_4 + f(f, u, u') = g(f) \quad u$$

$$u_4 + f(f, u, u') = g(f) \quad u$$

$$u_4 + f(f, u, u') = g(f) \quad u$$

$$u_4 + f(f, u, u') = g(f) \quad u$$

$$u_4 + f(f, u, u') = g(f) \quad u$$

$$u_4 + f(f, u, u') = g(f) \quad u$$

$$u_4 + f(f, u, u') = g(f) \quad u$$

$$u_4 + f(f, u, u') = g(f) \quad u$$

$$u_4 + f(f, u, u') = g(f) \quad u$$

$$u_4 + f(f, u, u') = g(f) \quad u$$

$$u_4 + f(f, u, u') = g(f) \quad u$$

$$u_4 + f(f, u, u') = g(f) \quad u$$

$$u_4 + f(f, u, u') = g(f) \quad u$$

$$u_4 + f(f, u, u') = g(f) \quad u$$

$$u_4 + f(f, u, u') = g(f) \quad u$$

$$u_4 + f(f, u, u') = g(f) \quad u$$

$$u_4 + f(f, u, u') = g(f) \quad u$$

$$u_4 + f(f, u, u') = g(f) \quad u$$

$$u_4 + f(f, u, u') = g(f) \quad u$$

$$u_4 + f(f, u, u') = g(f) \quad u$$

$$u_4 + f(f, u, u') = g(f) \quad u$$

$$u_4 + f(f, u, u') = g(f) \quad u$$

$$u_4 + f(f, u, u') = g(f) \quad u$$

$$u_4 + f(f, u, u') = g(f) \quad u$$

$$u_4 + f(f, u, u') = g(f) \quad u$$

$$u_4 + f(f, u, u') = g(f) \quad u$$

$$u_4 + f(f, u, u') = g(f) \quad u$$

$$u_4 + f(f, u, u') = g(f) \quad u$$

$$u_4 + f(f, u, u') = g(f) \quad u$$

$$u_4 + f(f, u, u') = g(f) \quad u$$

$$u_4 + f(f, u, u') = g(f) \quad u$$

$$u_4 + f(f, u, u') = g(f) \quad u$$

$$u_4 + f(f, u, u') = g(f) \quad u$$

$$u_4 + f(f, u, u') = g(f) \quad u$$

$$u_4 + f(f, u, u') = g(f) \quad u$$

$$u_4 + f(f, u, u') = g(f) \quad u$$

$$u_4 + f(f, u, u') = g(f) \quad u$$

$$u_4 + f(f, u, u') = g(f) \quad u$$

$$u_4 + f(f, u, u') = g(f) \quad u$$

$$u_4 + f(f, u, u') = g(f) \quad u$$

$$u_4 + f(f, u, u') =$$

Eigenvalue Problems with ODEs

► Generalized eigenvalue problems arise from more sophisticated ODEs,

$$u'' = \lambda (g(t)u + h(t)u'), \text{ with boundary conditions } u(a) = 0, u(b) = 0$$

$$u_{1+1} - 2h_1 + h_{1-1}$$

$$= \lambda (g(t)u + h(t)u'), \text{ with boundary conditions } u(a) = 0, u(b) = 0$$

$$\lambda (u) + h(t)u', h(t$$
