What's the point of this class?

PDEs describe lots of things in nature:

- Fluid flow
- Electromagnetics
- ✓ Adv/diff
- Plasmas
- Mechanics

Idea: Use them to

- make predictions and check them / check models
- use predictions to answer design questions

Survey

- ▶ Home dept
- ▶ Degree pursued
- ▶ Longest program ever written
 - ▶ in Python?
- ▶ Research area

Class web page

PDEs: Example 1

$u(x, t)$

What does this do? $\partial_t u = \partial_x u$

- slope in x and t is identical
- maybe a profile propagated on a drag

PDEs: Example II

"boundedness in x "

What does this do? $\partial_x^2 u + \partial_y^2 u = 0$

"boundedness in x " = - "b. in y "

- maybe no interior maxima

Some good questions

→ causality

- ▶ What is a time-like variable? (Variables labeled t ?)
- ▶ What if there are boundaries?
 - ▶ In space?
 - ▶ In time?
- ▶ Existence and Uniqueness of Solutions?
 - ▶ Depends on where we look (the *function space*)
 - ▶ In the case of the two examples? (if there are no boundaries?)

"BC"
"IC"

Some general takeaways:

use intuition, it helps

PDEs: An Unhelpfully Broad Problem Statement

Looking for $u : \Omega \rightarrow \mathbb{R}^n$ where $\Omega \subseteq \mathbb{R}^d$ so that $u \in V$ and

$$F(u, u_x, u_y, u_{xx}, u_{xy}, u_{yy}, \dots, x, y, \dots) = 0$$

Notation

Used as convenient:

$$u_x = \partial_x u = \frac{\partial u}{\partial x}$$

Properties of PDEs

What is the **order** of the PDE?

highest derivative taken

When is the PDE **linear**?

have u, v solutions $\alpha u + \beta v$ also a sol.

When is the PDE **quasilinear**?

The dep. in F on the highest-order deriv. is linear.

When is the PDE **semilinear**?

It is quasilinear and if the h.o.c. only depend on space.

Examples: Order, Linearity?

$$(xu^2)u_{xx} + (u_x + y)u_{yy} + u_x^3 + yu_y = f$$

QL 2nd

$$(x + y + z)u_x + (z^2)u_y + (\sin x)u_z = f$$

SL 1st

Properties of Domains

$$\Omega \subseteq \mathbb{R}^n$$

- has corner
- convex / has reentrant corners,
- satisfies minimum angle req.

May influence existence/uniqueness of solutions!

Function Spaces: Examples

Name some function spaces with their norms.

- C^0 : continuous

- C^1

- C_c : compactly continuous

- $L_p(\Omega)$ $\|f\|_p = \sqrt[p]{\int_{\Omega} |f(x)|^p dx}$

↳ $p=2$: inner product / define equiv. classes

- $W_p^1(\Omega)$: $\|f\|_{W_p^1} = \|f\|_p + \|f'\|_p < \infty$

May also influence existence/uniqueness of solutions!

$$H^1 = W_2^1$$

Hilbert: complete + inner prod.

Solving PDEs

Closed-form solutions:

- ▶ If separation of variables applies to the domain: good luck with your ODE
- ▶ If not: Good luck! → Numerics

General Idea (that we will follow some of the time)

- ▶ Pick $V_h \subseteq V$ finite-dimensional
 - ▶ h is often a *mesh spacing*
- ▶ Approximate u through $u_h \in V_h$
- ▶ Show: $u_h \rightarrow u$ (in some sense) as $h \rightarrow 0$

Example

About grand big unifying theories

Is there a grand big unifying theory of PDEs?

no

Collect some stamps

$$a(x, y)u_{xx} + 2b(x, y)u_{xy} + c(x, y)u_{yy} + d(x, y)u_x + e(x, y)u_y + f(x, y)u = g(x, y)$$

Discriminant value	Kind	Example
$b^2 - 4ac < 0$	Elliptic	Laplace $u_{xx} + u_{yy} = 0$
$b^2 - 4ac = 0$	Parabolic	Heat $u_t = u_{xx}$
$b^2 - 4ac > 0$	Hyperbolic	Wave $u_{tt} = u_{xx}$

Where do these names come from?

quadratic forms

Classification in higher dimensions

$$Lu := \sum_{i=1}^d \sum_{j=1}^d a_{i,j}(x) \frac{\partial^2 u}{\partial x_i \partial x_j} + \text{lower order terms}$$

Consider the matrix $A(x) = (a_{ij}(x))_{i,j}$. May assume A symmetric. Why?

Schwarz's thm.

What cases can arise for the eigenvalues?

real eigvals

$\lambda = 0$
for some $\lambda \rightarrow$ parabolic

$\lambda(x)$ all have same sign

$\lambda(x)$ all but one \rightarrow elliptic
 \rightarrow hyperbolic

more than one of each sign

\rightarrow ultra-hyperbolic

Elliptic PDE: Laplace/Poisson Equation

$$\Delta u = \sum_{i=1}^d \frac{\partial^2 u}{\partial x_i^2} = \nabla \cdot \nabla u(x) \stackrel{2D}{=} u_{xx} + u_{yy} = f(x) \quad (x \in \Omega)$$

Called **Laplace equation** if $f = 0$. With **Dirichlet boundary condition**

$$u(x) = g(x) \quad (x \in \partial\Omega).$$

Demo: Elliptic PDE Illustrating the Maximum Principle

$$g(x) = \sin(\alpha)$$

$$u(r, \theta) = u(r) \cdot V(\theta)$$

Elliptic PDEs: Singular Solution

Demo: Elliptic PDE Radially Symmetric Singular Solution

Given $G(x) = C \log(|x|)$ as the **free-space Green's function**, can we construct the solution to the PDE with a more general f ?

What can we learn from this?

.
